

End of Day Cashing Up Checklist

Prepare the Float (£60)

Note: The float should be made up primarily of small-denomination coins to ensure sufficient change is available for customers throughout the day. Avoid making up the float using notes or large quantities of higher-value coins such as £2 or £1 coins, as these are less useful when providing change.

Steps

1. ☐ Leave **all money in the till** before starting (if you take all the money out it is easy to get confused between the banking and the float money).
2. ☐ Count **£1 coins** into piles of **10** (£10 per pile).
3. ☐ Count **50p coins** in pairs ($50p \times 2 = £1$) – 2 rows of 5 pairs = **£10**.
4. ☐ Count **20p coins** in piles of **5** ($5 \times 20p = £1$) – 2 rows of 5 piles = **£10**.
5. ☐ Count **5p coins** in piles of **20** ($20 \times 5p = £1$) – 10 piles = **£10**.

6. ☐ Continue counting until a total float of **£60** has been made up. Note that you might not make up £10 of the same type of coin each time so you may have to make piles of two types of coin.

7. ☐ Place the £60 float into the temporary float container.
8. ☐ Set the float aside (keep it separate from the float money).

Calculate the Banking

1. ☐ Count all remaining notes and coins left in the till.
2. ☐ Record the total amount of cash remaining.
3. ☐ This remaining amount is the **banking for the day**.

Final Checks

1. ☐ Temporary float totals **£60**.
2. ☐ Banking amount has been counted and recorded.
3. ☐ Float and banking have been secured appropriately.
